

ARTICLE IMPORT

EFFICIENT AND SAFE THROUGH AUTOMATION

USE CASES

The master data of all articles must be managed in the Arvato CSDB before production. The initial article creation, during or after commissioning the system, is often associated with tremendous manual effort, as a large number of articles has to be created in a short amount of time. On top of that, the mass changes that occur after system updates can cause load peaks.

SOLUTION

The articles are automatically imported or updated from an Excel file into the Arvato CSDB. Additionally, Traxeed experts review provided data, avoiding common problems caused by incorrect article configuration.

ADVANTAGES

- Elimination of errors introduced by manual article creation in the CSDB (e.g. typing errors).
- Resource saving, as the time required for article creation is significantly reduced. The savings of resources scale with the number of articles to be created.
- Access to expert knowledge

Arvato CSDB Use Case

- VA-002 (Create article)
- VA-021 (Edit article)

Prerequisites

- Provision of article master data in Excel file(s)
- Access to CSDB Web Service Interface
